

Solving Systems Using Substitution

11/10

* At least one of the equations must be in $y =$ form (OR $x =$ form)

Steps

1. Get 1 equation into $y =$ (pick the easy one)
 2. Substitute the expression you found in for "y" in the 2nd equation & Solve
 3. Repeat step 2, BUT Solve for 2nd variable
 4. Answer is an ordered Pair (x,y)
- * You cannot solve an equation that has 2 different variables *

Nov 5-7:26 AM

Examples

1. $y = 5$

$$3x + 2y = 37$$

$$3x + 2(5) = 37$$

$$3x + 10 = 37$$

$$\frac{-10}{-10} \quad \frac{-10}{-10}$$

$$3x = 27$$

$$\frac{3}{3} \quad \frac{3}{3}$$

$$x = 9$$

$$(9, 5)$$

2. $y = 3x - 5$ $y = 3(-1) - 5$

$$8x + y = -16 \quad y = -3 - 5$$

$$y = -8$$

$$8x + 3x - 5 = -16$$

$$11x - 5 = -16$$

$$\frac{+5}{+5} \quad \frac{+5}{+5}$$

$$11x = -11$$

$$\frac{11}{11} \quad \frac{11}{11}$$

$$x = -1$$

$$(-1, -8)$$

$$y = -8$$

$$(-1, -8)$$

Nov 5-8:22 AM

$$\textcircled{3} \quad 5x - y = 5 \rightarrow \frac{-y}{-1} = \frac{-5x + 5}{-1}$$

$$-x + 3y = 13 \quad y = 5x - 5$$

$$-x + 3(5x - 5) = 13$$

$$-x + 15x - 15 = 13$$

$$+15 \quad +15$$

$$\frac{14x}{14} = \frac{28}{14}$$

$$x = 2$$

$$(2, 5)$$

$$5x - y = 5$$

$$5(2) - y = 5$$

$$10 - y = 5$$

$$-10 \quad -10$$

$$-y = -5$$

$$y = 5$$
